

WHAT WE DO

The industry’s first “agentic security platform”, offloading essential “non-human work” to autonomous AI agents. Unlike AI SOC analysts, chatbots, or co-pilots, 7AI’s system of specialized AI agents handles repetitive security tasks—quickly, comprehensively, and autonomously—freeing highly-trained cybersecurity professionals to focus on high-value work that improves security outcomes.

DO HUMAN WORK.

HOW WE DO IT

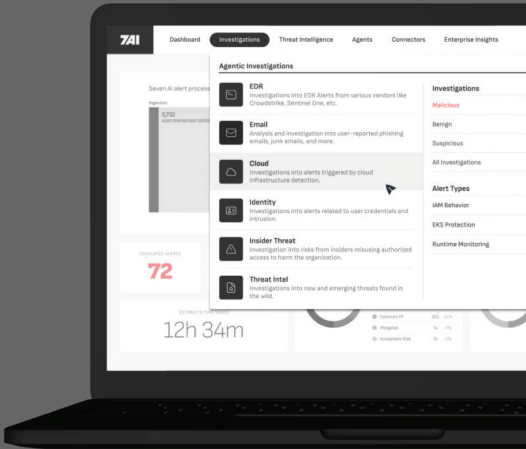

7AI is deployed in the cloud with API connections to tools. Triggered by an alert, agents then provide:

Categorization and Dispatch:
AI agents determine which type of threat an alert pertains to, with examples including EDR, Cloud, Email, and Identity solutions. 7AI dispatches AI agents accordingly.

Specialized Execution:
Dozens of expert agents investigate specific components—querying data from multiple data sources in the customer’s environment—working in parallel for maximum efficiency.

Integrated Decisions:
Findings are compiled into actionable conclusions for analysts, ticketing systems, or playbooks. Additional agents then calculate the blast radius and perform follow-on investigations when relevant.

Enterprise Insights:
By integrating with a customer’s internal policies and understanding roles, 7AI agents understand the nuance needed to make a conclusion, including policies, roles, and other factors that can’t be considered by rules-based AI SOC tools.

WHAT WE SOLVE

In every cybersecurity team, employees spend time on essential work that doesn’t require human creativity: triaging alerts, enriching signals, correlating telemetry, searching for known threats, and more. These tasks are vital but time-consuming, making them ideal for AI agents.

WHAT CUSTOMERS GET

- Fewer false positives, as agents continuously learn and improve over time.
- Capacity increases, as analysts offload repetitive tasks to AI.
- Faster response times, reducing MTTR and improving overall outcomes.
- Cost reduction, as AI agents are able to investigate data where it was born instead of replicating, formatting, and pushing duplicate data to other systems.

THE COMPANY

Founded in 2024 by Lior Div and Yonatan Striem-Amit, creators of Cybereason, and supported by \$36 million in seed funding from Greylock Partners, Spark Capital, and CRV, 7AI is already running in production in dozens of companies today. In less than one year, the company has gone from concept to general availability, earning the trust of innovative security teams across industries.
